Mask

Your AI doesn’t need everything.

Local privacy for the messages we send to AI

Company information is already going to AI

48%

of surveyed employees using AI at work reported uploading company information to public AI tools.

University of Melbourne and KPMG, 2025

Self-reported sharing. The study does not establish whether each upload was necessary or authorised.

Customer complaints

Customer identities masked. Complaint text retained.

Original

C-1042, Emma Wilson, emma.wilson@example.com

Filtered locally

[ACCOUNT_ID], [PERSON_1], [EMAIL]

“I was charged twice for the same order.”

Rehearsed synthetic example: 3 duplicate charges, 2 delayed refunds, 1 password-reset problem

Since AI's own benchmark

Mask1 scores 98.9 vs 98.3 on the original identifier test

Detector	Identifiers F1	Names F1	Secrets F1	Clean docs flagged
SafePrompt	98.3	0.0*	100.0	1 / 299
Mask1	**98.9**	**100.0**	**100.0**	**15 / 299**
Mask2	98.3	100.0	100.0	57 / 299
MaskMini	98.9	90.3	100.0	132 / 299

1,500 synthetic documents. Same scorer. F1 (%). Fewer false alerts is better.

*SafePrompt does not detect names. Names use fixed forms; secrets follow known formats.

The question changes what matters

Models trained for relevance

Our own synthetic data. DeBERTa models adapted to identify sensitive information and judge what the question needs.

The filtering system runs locally and applies precise edits before anything goes to the chatbot.

Current challenge: removing unrelated passages reliably

Privacy across the AI tools people use

We will make local privacy protection part of everyday AI use.

Browser extensions for individuals

Company integrations with internal data rules
